# Lifeboats Featuring STA-PUT<sup>®</sup>

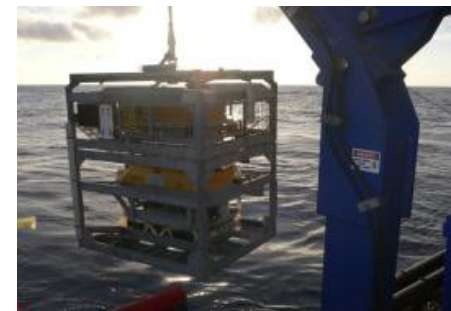

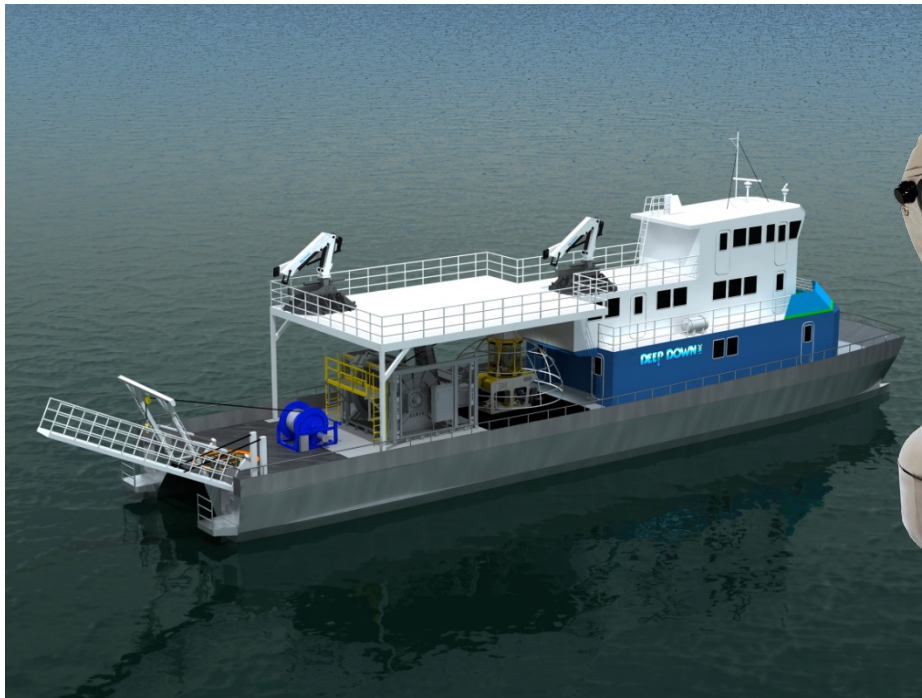

Our Sta-Put system installed on lifeboats enables the vessel once released to return to the correct lifting position automatically utilizing the "Go Home" button. The boat can move away in any direction with a touch of the joy-stick. It can maintain position utilizing the compact on board computer, continuous duty bow thruster, stern thruster, conventional propeller and rudder - a total solution. Eliminating much of the former stress and time associated with mandatory lifeboat drills or emergencies.

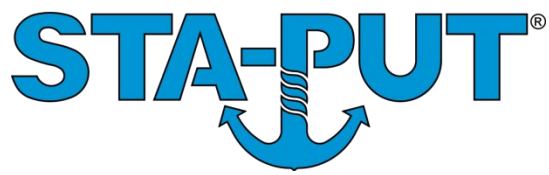

# Deep Down Crew / Work Cat with STA-PUT<sup>®</sup>

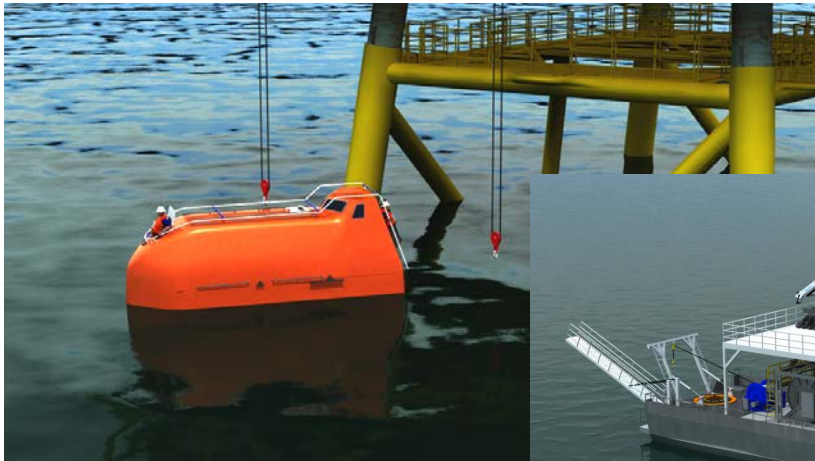

This multi-purpose vessel featuring our Sta-Put system will greatly enhance rapid response surface / subsea services. It can operate above 18 knots, safely carry crew and equipment for transfer, and perform simple pipe laying, surveys and inspections. Manned by a small cross trained crew in marine and ROV operations, it is able to instantly transition into work cat mode. Possessing a work class ROV with video telemetry it can broadcast the ROV signal to a remote location. HSE and security is provided by incorporating thermal CCTV with remote live monitoring.

## Station Keeping System

The Deep Down Sta-Put system was specifically designed to take a complex undertaking and make it simple and less expensive. Reducing the size and complexity, it is now possible to install station keeping systems into smaller vessels. Providing the ability to maintain position and equipped with joystick controls avoids the need for larger more expensive vessels. Why spend millions for a complicated DP system when Sta-Put opens the door for a whole new class of vessel operations for far less investment.
